UTC/SEF as a Foundational Audit Substrate

Two Applied Methodologies on One Fractal Cycle:
Resonant Transformation (forward pass) and **Ontic Tracing** (backward pass)
Operator notation, conceptual graphs, checklists, worksheets, and a large casebook

Kevin T.N Independent Researcher email: jkdkr2439@gmail.com

Working monograph for daily deployment (not a submission manuscript)

Abstract

This monograph is designed to be **used**. It separates a foundational audit substrate (UTC/SEF) from two applied methodologies that operate on the same four-phase transformation cycle in opposite directions. UTC/SEF enforces statement hygiene through: (i) the Label–Meaning–Frame (LMF) gate, (ii) a three-layer reality model (R1 subjective experience, R2 intersubjective language and truth-conditions, R3 objective constraints inferred indirectly), and (iii) a mandatory level-of-description lock $[L]$ that prevents scale confusion. On top of this substrate: **Resonant Transformation** (RT) is a forward-pass method typically entered at **Transition(Decay/Assimilation)** when a system is collapsing or shifting, mapping next phases to forecast structural evolution and design interventions. **Ontic Tracing** (OT) is a backward-pass method for locating generative conditions, tracing from present structure toward Birth and Void while explicitly acknowledging underdetermination. A unifying **fractal scale-invariance principle** is included: each phase contains an internal full cycle, and each full cycle can be treated as a phase of a larger cycle. The document includes protocols, operator formalization, overflow-safe diagrams, and a heavy casebook across organizational, personal, and socio-technical domains.

Keywords: statement hygiene, reference frames, truth-conditions, scale invariance, collapse mapping, root tracing, phase cartography, structural resonance, epistemic entropy.

1 How to Use This Monograph (Operational Mode)

1.1 Three-layer tool stack

Use this document as a stack:

- **Always-on substrate:** UTC/SEF (LMF, R1/R2/R3, $[L]$, clean statements).
- **Directional method:** choose RT (forward) or OT (backward).
- **Scale control:** fractal nesting means phase identity depends on $[L]$.

1.2 Core refusal (what this will not do)

Principle 1 (Non-Claim R3 (scope lock))**.** *UTC/SEF is an R2 discipline: it describes how humans coordinate meaning and evaluate propositions through language and protocols. It does not claim direct possession of R3; it stays honest about inference boundaries.*

Principle 2 (No moralizing / no mind-reading)**.** *This monograph audits* ***statements and structures****, not people. It does not complete ambiguous claims with assumed intent. Missing inputs stay missing until specified.*

2 Part I — UTC/SEF as Foundational Audit Substrate

2.1 Why an audit substrate exists

Most "deep disagreements" are avoidable failure modes:

- key terms used without definitions,
- evaluation frames left implicit,
- subjective reports treated as external facts (or vice versa),

- scientific models mistaken for reality itself,
- metaphor sliding into mechanism,
- scale drifting mid-discussion.

The substrate exists to force these into the open *before* content debate.

2.2 The LMF gate (Label–Meaning–Frame)

Definition 1 (Label)**.** A **Label** is a surface term carrying conceptual load in a claim (e.g., "cause," "truth," "exists," "time," "energy").

Definition 2 (Meaning)**.** **Meaning** is a working definition including: (i) conditions of correct application, (ii) boundary conditions (when it does not apply), and (iii) the role the term plays in the active question.

Definition 3 (Reference Frame (RF))**.** A **Reference Frame** is the evaluation system that determines what counts as evidence and correctness (logic, physics, engineering, law, social norms, phenomenology, etc.), including who/what validates and by which protocol.

Principle 3 (LMF gate (no evaluation without lock))**.** *Do not evaluate truth/falsehood (or correctness/incorrectness) before locking Label, Meaning, and Reference Frame. If any is missing, the statement is not well-posed for evaluation.*

> **Field move:** when someone says "it's obvious," interpret it as "the frame and definitions are hidden." Ask for the hidden frame. Do not fight the content yet.

2.3 Minimal prompts to lock LMF

For any claim p:

- **Label:** Which 2–6 words carry the load here?
- **Meaning:** What would count as correct usage of each word *in this sentence*?
- **Frame:** Under which system is it judged? Who/what decides correctness? What protocol?

2.4 Three reality layers (UTC): R1/R2/R3

Definition 4 (R1: subjective layer)**.** R1 is first-person experience: attention, felt time, emotion, imagery, inner narrative. It is real as experience but not directly shareable as an object.

Definition 5 (R2: intersubjective layer)**.** R2 is language, symbols, models, institutions, conventions, and truth-conditions. Propositions live here and can be evaluated under declared frames.

Definition 6 (R3: constraint layer (indirect))**.** R3 denotes constraints independent of belief. We infer R3 through traces, measurements, and the stress-testing of R2 models; we do not claim direct access.

Principle 4 (Layer hygiene)**.** *Never identify an R2 description (even a strong scientific model)*

with R3 itself. Always tag whether a claim is about R1, R2, R3, or a controlled mixture.

2.5 Event vs. truth (stop mixing targets)

Definition 7 (Event)**.** An **event** is something that happens (or does not happen). It is commonly treated as tied to R3 constraints as a source of traces.

Definition 8 (Truth)**.** **Truth** is a property of a proposition (R2) under a reference frame and explicit truth-conditions.

Principle 5 (Target question)**.** *When someone says "that's true," ask: are we discussing an event (what happened) or a proposition (a statement about what happened)?*

2.6 Level-of-description $[L]$: scale lock

Definition 9 (Level-of-description $[L]$.] $[L]$ is the declared scale at which a claim is meant to function (micro/meso/macro, or any explicit ladder). $[L]$ determines which phase classification is meaningful in fractal systems.

Principle 6 ($[L]$. *lock] Any application of RT or OT begins by locking* $[L]$*. Without* $[L]$*, the same phenomenon can be misclassified into the wrong phase and the wrong method.*

Practical takeaway: UTC/SEF runs underneath RT and OT as audit substrate, not as a competing method.

2.7 Clean statement grammar (the output contract)

Definition 10 (Clean statement)**.** A clean statement is a proposition packaged with: locked LMF, layer tags, $[L]$, applicability conditions, truth-conditions, and explicit non-claim limits.

Template (copy/paste):
[RF=...] [Layer=...] [L=...] [Q=...] [Truth-conditions=...]
Proposition: ...
Applicability: ...
Non-claim limits: ...
Cycle map: Void(Data=...) → Birth(Input=...) → Guidance(Process=...) → Transition(Decay/Assimilation=...).

2.8 Truth-conditions by frame (quick taxonomy)

Truth-conditions depend on RF. You can reuse these categories:

- **Formal (logic/math):** validity, derivability, consistency.
- **Empirical (science):** measurement protocol, error bounds, replication/robustness.
- **Engineering:** performance metrics under specified constraints (works/doesn't work).
- **Normative (law/policy):** authority + procedure + jurisdiction.

- **Phenomenological:** fidelity to experience reports + coherence under careful description.

3 Part II — One Canonical Cycle, Two Directions

3.1 Canonical cycle (display-safe)

Definition 11 (Canonical cycle)**.**

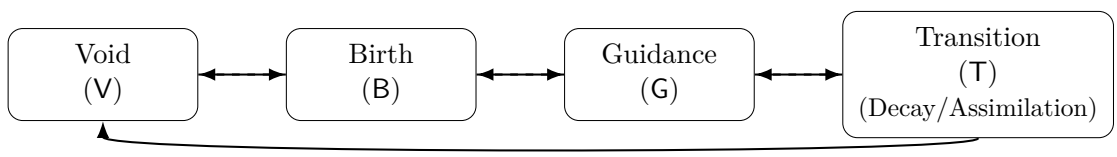
$$\begin{aligned}&\textbf{Void(Data)} \to \textbf{Birth(Input)} \to \textbf{Guidance(Process)}\\ &\qquad\qquad \to \textbf{Transition(Decay/Assimilation)} \to \textbf{Void(Data updated)}.\end{aligned}$$

3.2 Phase semantics (usable, not metaphysical)

- **Void(Data):** latent field of possibilities not currently retrieved. Not "nothing."
- **Birth(Input):** activation of data into input via attention, measurement, anomaly, question, signal, conflict.
- **Guidance(Process):** transformation mechanism: inference, training, negotiation, experiments, filters, incentives.
- **Transition(Decay/Assimilation):** structural update. Old structure loses hold (Decay) while new structure integrates (Assimilation). Inseparable aspects of one phase.

Warning 1 (Strict rule)**.** Do not treat Decay and Assimilation as separate phases. They belong inside Transition.

3.3 Overflow-safe cycle diagram (two directions)



Forward pass is used for planning and emergence mapping. Backward pass is used for tracing generative conditions. Both require $[L]$ lock and LMF lock.

Figure 1: One cycle, two directions: forward (planning/RT) and backward (OT).

4 Part III — Applied Methodology A: Resonant Transformation (RT)

4.1 Definition and intent

Definition 12 (Resonant Transformation (RT))**.** RT is a forward-pass methodology typically entered at Transition when a system is collapsing, shifting, or losing stability. It maps the next phases forward to forecast structural evolution and design interventions that stabilize or redirect the emerging structure.

4.2 When to choose RT

- "We are collapsing/shifting. What is decaying and what is integrating?"
- "What comes next at this scale, and how do we shape it?"
- "Where are the intervention levers: Birth, Guidance, Transition, Void?"

4.3 RT protocol (full)

Protocol 1 (RT protocol)**.** Given raw input u:

1. Audit: $q \leftarrow \mathcal{A}(u)$. Lock LMF, layer tags, $[L]$, truth-conditions, non-claim.
2. Confirm phase: classify current state as Transition at the declared $[L]$. If not, re-enter at the correct phase.
3. Decompose Transition:
   - **Decay:** what structures are losing hold?
   - **Assimilation:** what new constraints/structures are integrating?
4. Map the new Void: what possibility space opens after the shift?
5. Forecast Birth: what inputs now become likely (triggers, anomalies, demands, attention magnets)?
6. Map Guidance: what processes will shape those inputs (protocols, incentives, culture, filters)?
7. Forecast the next Transition: what stable configuration is likely, and what failure modes may recur?
8. Intervene via one of four levers:
   - B-lever: change inputs/triggers,
   - G-lever: change process/incentives/protocols,
   - T-lever: manage Decay/Assimilation explicitly,
   - V-lever: reshape what stays latent vs active (attention + backlog architecture).

4.4 Validation discipline (anti-storytelling)

Warning 2 (RT failure mode)**.** Forward mapping can become confident storytelling. RT requires validation signals: specify what observations would count as evidence the forecast is wrong.

Protocol 2 (RT stopping rule)**.** Stop forecasting when:

- no observable signals can be stated for the next phase,
- the map depends on hidden frames or undefined meanings,
- $[L]$ drifts mid-map.

Return to the audit substrate and re-lock.

5 Part IV — Applied Methodology B: Ontic Tracing (OT)

5.1 Definition and intent

Definition 13 (Ontic Tracing (OT))**.** OT is a backward-pass methodology for locating generative conditions. It traces from a present configuration backward to identify plausible upstream inputs, processes, and latent fields. OT outputs candidate ancestries under explicit tolerance; it does not claim uniqueness without discriminating evidence.

5.2 When to choose OT

- "How did this arise structurally?"
- "Which upstream triggers/processes produced this collapse pattern?"
- "What latent assumptions made this chain plausible?"

5.3 OT protocol (full)

Protocol 3 (OT protocol)**.** Given raw input u:

1. Audit: $q \leftarrow \mathcal{A}(u)$. Lock LMF, layer tags, $[L]$, truth-conditions, non-claim.
2. Declare tolerance: what counts as "same enough" at this $[L]$?
3. Reverse Transition: what had to decay? what assimilated?
4. Reverse Guidance: which processes/incentives/filters did the work?
5. Reverse Birth: which triggers/inputs started the chain?
6. Reverse Void: what latent model inventory/background assumptions made it plausible?
7. Output candidate ancestries + discriminating tests + explicit boundary.

Warning 3 (OT failure mode)**.** Backtracking can become infinite regress. OT needs a stopping rule or it becomes mythology.

Protocol 4 (OT stopping rule)**.** Stop when:

- observability boundary reached under the declared RF and $[L]$,
- further tracing does not change actionable guidance,
- candidates cannot be distinguished with available evidence.

State the boundary honestly.

6 Part V — Fractal Scale-Invariance (Why $[L]$ Is Mandatory)

Principle 7 (Fractal phase nesting)**.** *At a declared $[L]$, each phase contains an internal full cycle at finer scale, and a full cycle at $[L]$ can be treated as a phase of a larger cycle at $[L^+]$. Therefore*

phase identity is scale-dependent.

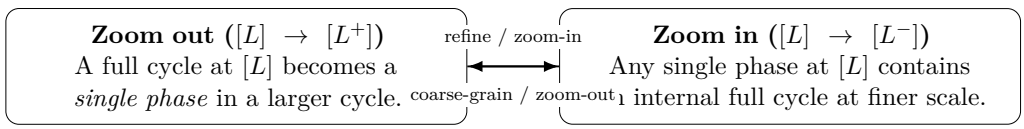
6.1 Practical consequence

The same "event" can be:

- Birth at micro-scale (a trigger appears),
- Guidance at meso-scale (a process unfolds),
- Transition at macro-scale (a structure collapses/reforms).

Protocol 5 (Scale-first protocol)**.** 1. Declare $[L]$ (your scale ladder).

2. Classify phase at that scale.
3. Choose method (RT vs OT).
4. If stuck, explicitly zoom in/out, re-declare $[L]$, re-classify.



Rule of thumb: if the map feels contradictory, you are probably mixing scales. Lock $[L]$ and re-run phase classification.

Figure 2: Fractal nesting: cycles contain cycles; cycles are phases of larger cycles.

7 Part VI — Operator Formalization (Usable Notation)

7.1 Spaces

Definition 14 (State representation)**.** Let $S \equiv S(\mathrm{RF}, L) \in \mathcal{S}_{\mathrm{RF},L}$ denote a state representation at a declared reference frame and scale.

Definition 15 (Phase label set)**.** $\Phi := \{\mathsf{V}, \mathsf{B}, \mathsf{G}, \mathsf{T}\}$, where T includes Decay/Assimilation as a dual-aspect update.

7.2 Audit operator

Definition 16 (Raw utterances and clean statements)**.** Let U be raw utterances. Let Q be clean statements:

$$q = (\mathrm{LMF}, \mathrm{LayerTags}, L, \mathrm{Applicability}, \mathrm{NonClaim}, \mathrm{TruthConditions}).$$

Definition 17 (Audit operator)**.**

$$\mathcal{A} : U \to Q,$$

mapping raw utterances into clean statements by forcing explicit locks.

7.3 Phase operators and cycle operator

Definition 18 (Phase operators)**.** At fixed (RF, L):

$$\mathcal{B} : \mathsf{V} \to \mathsf{B}, \quad \mathcal{G} : \mathsf{B} \to \mathsf{G},$$
$$\mathcal{T} : \mathsf{G} \to \mathsf{T}, \quad \mathcal{V} : \mathsf{T} \to \mathsf{V}.$$

Definition 19 (Cycle operator)**.**

$$\mathcal{C} := \mathcal{V} \circ \mathcal{T} \circ \mathcal{G} \circ \mathcal{B}.$$

7.4 Forward vs backward passes

Definition 20 (Forward pass)**.**

$$\mathrm{Fwd}_k(S) := \mathcal{C}^k(S),$$

with intermediate phase readings as needed.

Definition 21 (Backward pass (set-valued))**.**

$$\mathrm{Bwd}_k(S) := \{S' \in \mathcal{S}_{\mathrm{RF},L} \ : \ \mathcal{C}^k(S') \approx S \text{ under declared tolerance}\}.$$

Remark 1. Treating Bwd as set-valued is the honest move: multiple ancestries can produce similar present states at a given $[L]$.

7.5 Scale mapping

Definition 22 (Scale mapping)**.** Let $R_{L \to L'} : \mathcal{S}_{\mathrm{RF},L} \to \mathcal{S}_{\mathrm{RF},L'}$ map representations across scales (zoom in/out). Any time you change scale, declare it.

8 Part VII — System Architecture Diagrams (No Overlap Edition)

8.1 Layered stack overview

9 Part VIII — Casebook (Expanded, Repeatable Patterns)

9.1 How to read the casebook

Each case follows the same pipeline:

1. Extract 1–3 propositions.
2. Lock LMF.
3. Tag R1/R2/R3 and lock $[L]$.
4. Apply RT (if collapse/shift) or OT (if origin tracing).
5. Write a clean statement + drift risks.

9.2 Case 1: Startup failure narrative ("the market was bad")

Example 1 (Raw statement)**.** "Our startup failed because the market was bad."

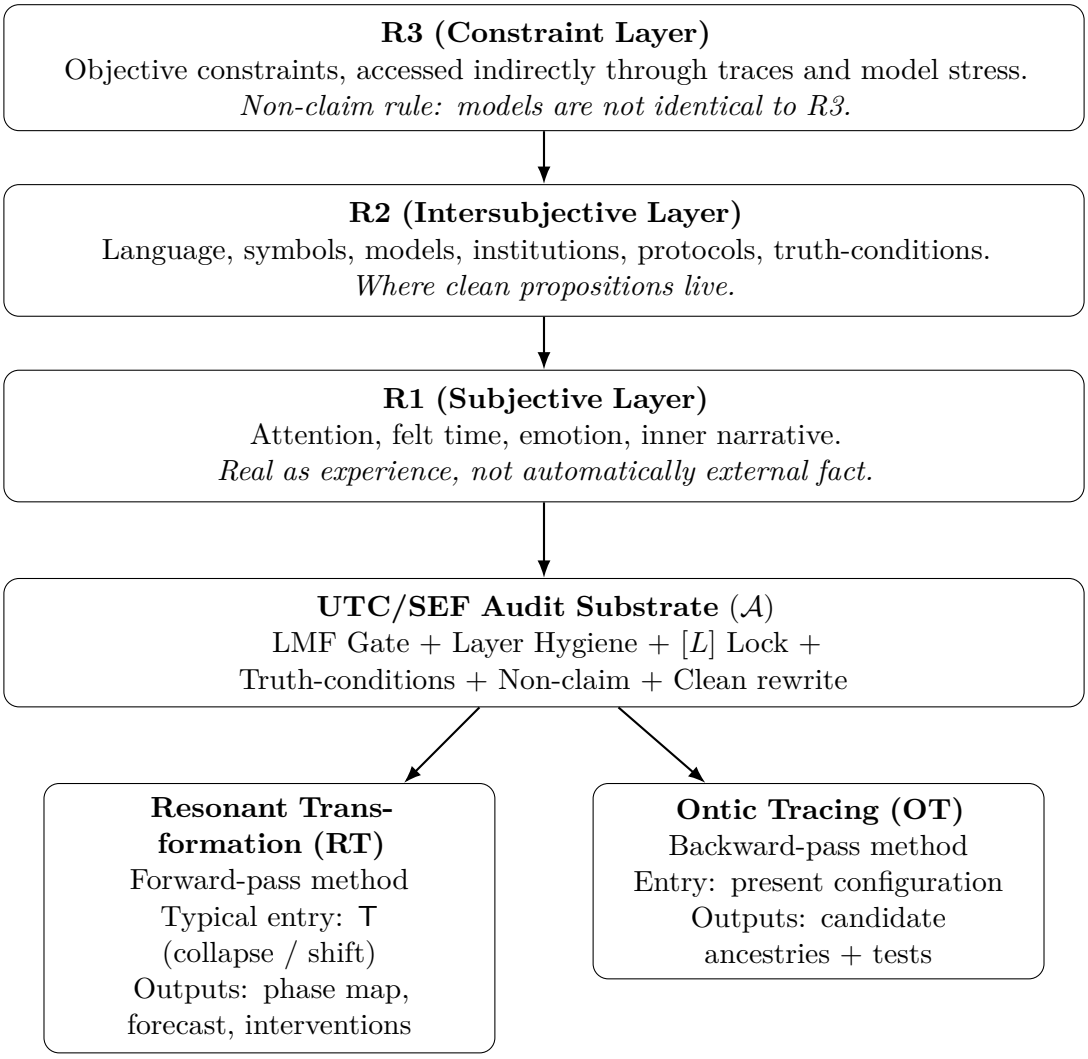


Figure 3: UTC/SEF runs underneath RT and OT as audit substrate, not as a competing method.

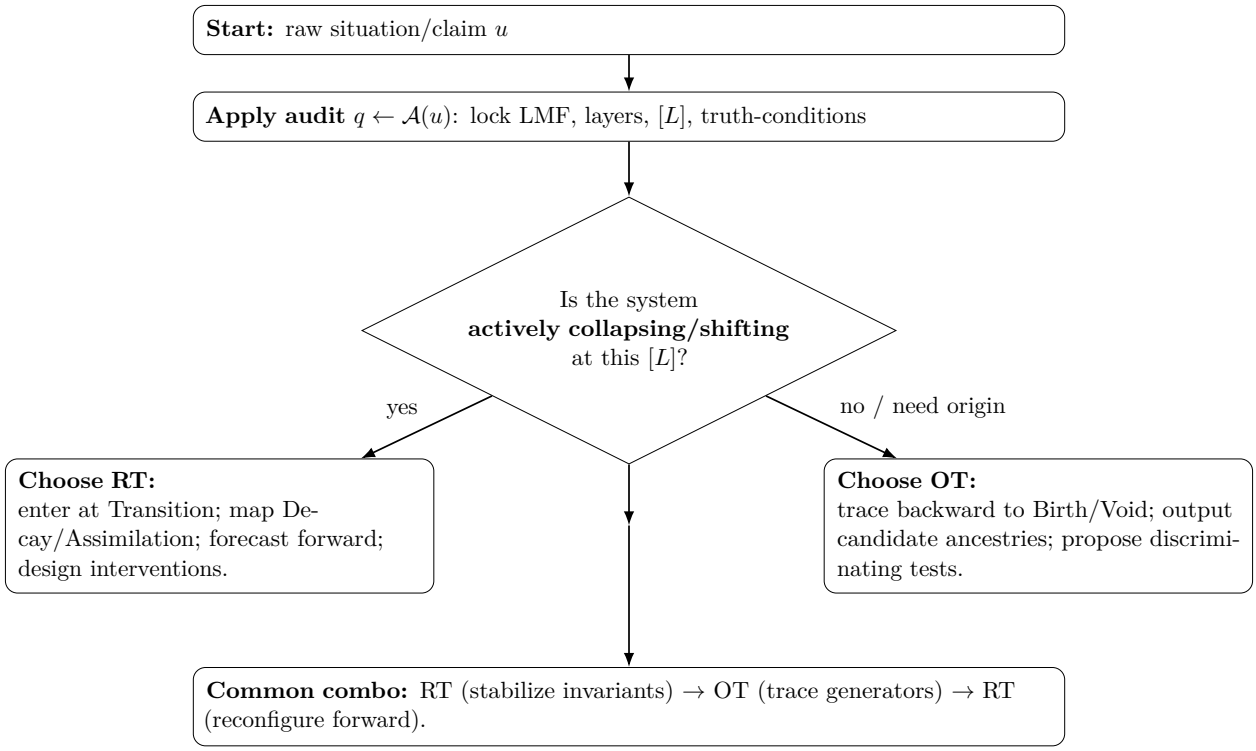

Figure 4: Method selection after audit and $[L]$ lock.

Propositions: p_1 market constraint is main generator; p_2 internal process not main generator.
LMF: define "failed" (runway? adoption? dissolution?), define "market" (demand? timing? pricing? regulation?), RF=business metrics.
Layers/$[L]$: mostly R2; $[L]$ = macro (months-to-years).
OT trace: Transition=collapse; reverse Guidance (pricing/distribution/burn), reverse Birth (thesis+signal interpretation), reverse Void (founder model inventory + funding environment).
Clean rewrite:

> **[RF=business metrics] [Layer=R2] [L=macro] [Q=What generated failure?] [Truth-conditions=retention + unit economics + timeline]**
> The outcome is a macro-scale Transition with Decay (runway/channel stability) and Assimilation (cash constraints + credibility constraints). "Bad market" is one constraint hypothesis; upstream Guidance and upstream Birth likely amplified it. OT outputs candidate ancestries and proposes discriminating checks.

Drift risks: frame slip ("market" as catch-all), definition drift (failure changes meaning), scale confusion.

9.3 Case 2: Product roadmap planning (prediction as designed Birth)

Example 2 (Raw goal)**.** "We need to predict the next 6 months and plan the roadmap."

LMF: "predict"=forecast under uncertainty; RF=engineering/product; $[L]$ = meso (quarter execution).

Forward map (entry at Birth): choose inputs (experiments), choose process (cadence), define update rules (Transition), update backlog (Void).
Clean rewrite:

> **[RF=engineering/product] [Layer=R2] [L=meso] [Q=How do we plan?] [Truth-conditions=delivery + outcome metrics]**
> Planning is designing Birth and Guidance so that future Transition yields learning rather than chaos; forecasts must include signals that would falsify them.

9.4 Case 3: "Time is an illusion" (layer split)

Example 3 (Raw statement)**.** "Time is an illusion."

Audit: split time into R1 lived, R2 measured, R3 constraints on change (inferred). Lock $[L]$ before phase talk.
Clean rewrite (one valid version):

> **[RF=phenomenology] [Layer=R1] [L=micro] [Q=What is lived duration?] [Truth-conditions=coherence with experience reports]**
> Felt time can be distorted by attention and memory dynamics.
> **Non-claim:** this does not deny clock-time in R2 or constraints on change in R3.

9.5 Case 4: "Energy in this room is rising" (metaphor hygiene)

Example 4 (Raw statement)**.** "The energy in this room is rising."

Audit: "energy" overloaded. Choose RF: physics (requires units+measurement) or social/phenomenological (engagement).
Clean rewrite:

> **[RF=social/phenomenological] [Layer=R1 →R2] [L=group] [Q=Describe engagement] [Truth-conditions=cues + self-reports]**
> Engagement is increasing (more speech turns, louder voice, higher attention).
> **Non-claim:** not a thermodynamic claim.

9.6 Case 5: Relationship collapse pattern (enter RT at Transition)

Example 5 (Raw statement)**.** "Things collapse when it gets serious. I sabotage relationships."

Layers: R1 fear/urgency; R2 identity-label; R3 constraints (time/health) may apply. $[L]$ = meso.
RT: Transition=collapse; Decay=trust narrative; Assimilation=avoidance as safety. Map forward to likely Birth (intimacy triggers) and Guidance (interpretation habits).
Intervention levers: change Birth triggers, change Guidance scripts, manage Transition explicitly.

9.7 Case 6: Team conflict ("they are toxic")

Example 6 (Raw statement)**.** "My teammate is toxic; the team can't function."

Audit: "toxic" is label-heavy and meaning-light. RF could be HR/normative vs engineering performance vs interpersonal dynamics. Lock LMF.

OT use: trace backward: which Birth events (trust rupture) + Guidance processes (feedback avoidance, misaligned incentives) produced present Transition (collaboration collapse)?
Clean rewrite direction: define observable behaviors + impact metrics + boundary conditions, then propose tests/interventions.

9.8 Case 7: Policy shift (regulation shock)

Example 7 (Raw statement)**.** "The new regulation killed our business model overnight."

RT: enter at Transition; Decay=old compliance assumptions; Assimilation=new constraint set. Map new Void (new market space), Birth (new compliance inputs), Guidance (process redesign), next Transition (stabilized model).

9.9 Case 8: Addiction loop (personal)

Example 8 (Raw statement)**.** "I keep relapsing even when I know it's ruining me."

Layers: R1 cravings; R2 self-story and plans; R3 physiological constraints. $[L]$ = micro for triggers, meso for habit loop.
Combine: OT to locate trigger Birth + Guidance (coping loop), then RT to redesign forward (change triggers, change process, manage Transition).

9.10 Case 9: Learning plateau (skill)

Example 9 (Raw statement)**.** "I'm stuck; I practice but don't improve."

RF: skill acquisition/engineering. OT: trace if practice inputs are wrong (Birth) or process lacks feedback (Guidance). RT: redesign training cycle with explicit Transition rules (update technique).

9.11 Case 10: Market bubble narrative (macro)

Example 10 (Raw statement)**.** "This is a bubble; it's going to crash soon."

LMF: "bubble" meaning? RF=finance/econ; truth-conditions are probabilistic. $[L]$ = macro.
RT: if in Transition, map Decay/Assimilation signals; forecast forward with falsifiable indicators, avoid prophecy tone.

9.12 Case 11: Science disagreement (model vs reality)

Example 11 (Raw statement)**.** "Quantum mechanics proves reality is not real."

Layer hygiene: R2 model claims are not R3 metaphysics. Demand RF + truth-conditions. Re-write as: "the model predicts X under protocol Y."

9.13 Case 12: Identity reconfiguration (career loss)

Example 12 (Raw statement)**.** "I lost my career identity; now everything is empty."

RT: enter at Transition; Decay=role label; Assimilation=new constraints/values. Map Void, Birth (experiments), Guidance (mentorship), next Transition (new identity).

9.14 Case 13: Social media spiral (attention occupation)

Example 13 (Raw statement)**.** "My mind is being hijacked by my phone."

Two occupation domains: R1 attention occupation, R3 energy/time constraints. OT: trace

triggers + reinforcement process. RT: redesign inputs/process (notifications, environment, rules).

9.15 Case 14: "Everything is subjective" (epistemic collapse)

Example 14 (Raw statement)**.** "All truth is subjective, so nothing is really true."

Fix: truth is property of R2 propositions under RF + conditions. Subjective reports live in R1; do not collapse layers. Provide clean rewrite with explicit RF.

9.16 Case 15: "I manifested it" (causality drift)

Example 15 (Raw statement)**.** "I manifested this outcome by believing hard enough."

Audit: is this R1 meaning-making, or R2 causal claim, or R3 mechanism claim? Lock RF. Without protocol, keep it as R1 narrative, not physics.

9.17 Case 16: "Culture is the strategy" (organizational)

Example 16 (Raw statement)**.** "Culture eats strategy for breakfast."

Fix: treat as R2 hypothesis: Guidance processes (norms/incentives) dominate plan text. Use OT to trace failures; use RT to intervene on Guidance.

9.18 Case 17: Security incident (engineering)

Example 17 (Raw statement)**.** "We got hacked because our team was careless."

OT: trace backward from breach Transition: which Guidance (review processes) and Birth (threat signals) and Void (security assumptions) enabled it? Avoid moralizing; output process-level fixes.

9.19 Case 18: Collective panic (society)

Example 18 (Raw statement)**.** "People are irrational; that's why this crisis escalated."

Fix: define "irrational" under RF; classify at $[L]$ macro. Use OT to trace triggers + incentives; use RT to map forward interventions (communication protocols, constraint management).

10 Part IX — Worksheets (One-page Forms You Can Reuse)

These sections intentionally add pages and make deployment practical.

10.1 Worksheet A: Clean statement builder

A1. Proposition extraction (1–3):

$p_1 =$ _____

$p_2 =$ _____

$p_3 =$ _____

A2. LMF lock:

Labels: _____

Meanings + conditions: _____

Reference Frame + validator + protocol: _____

A3. Layer tags + scale:

Layer tags: _____

[L] = _____ **Layer tag set =** _____

A4. Truth-conditions:

What would count as evidence for/against? _____

A5. Non-claim limits:

What are you explicitly *not* claiming? _____

10.2 Worksheet B: RT map

B0. Confirm scale and phase:

[L] = _____ **phase =** _____

B1. Transition decomposition:

Decay (what is losing hold?): _____

Assimilation (what is integrating?): _____

B2. New Void (opened possibility space):

_____

B3. Birth forecast (likely inputs):

_____

B4. Guidance forecast (process shaping inputs):

_____

B5. Intervention levers:

B/G/T/V

Chosen lever(s) + action: _____

B6. Falsification signals:

What would show you're wrong? _____

10.3 Worksheet C: OT trace

C0. Confirm scale and tolerance:

[L] = _____ **tolerance =** _____

C1. Reverse Transition:

What decayed before this? _____

What assimilated to enable this? _____

C2. Reverse Guidance:

Which processes/incentives/filters produced it? _____

C3. Reverse Birth:

Which triggers/inputs started the chain? _____

C4. Reverse Void:

Which latent assumptions/model inventory existed? _____

C5. Candidate ancestries (list 2–5):

1) _____

2) _____

3) _____

C6. Discriminating tests / signals:

_____

C7. Stopping boundary:

Where do you stop and why? _____

11 Part X — Error Catalog (Fast Debugging Under Pressure)

Error Mode	Symptom	Fix
Layer slip	R1 treated as R2 truth, or R2 model treated as R3	Force layer tags per proposition; rewrite cleanly.
Frame slip	Words from one RF evaluated in another	Declare RF + validator + protocol.
Definition drift	Meaning shifts midstream	Version definitions X_1, X_2, restate claim.
Scale confusion	Same phenomenon labeled different phases accidentally	Lock $[L]$; explicitly zoom in/out before re-labeling.
Event/truth mix	"It happened" vs "it's true" mixed	Split event statement and proposition truth statement.

Error Mode	Symptom	Fix
Metaphor drift	Metaphor treated as mechanism	Keep as R1 metaphor or supply measurement protocol.

12 Conclusion

UTC/SEF is the substrate that keeps the system honest. RT and OT are two directions on the same loop, chosen by question type after $[L]$ is locked. The fractal principle explains why scale cannot be implicit, and why mislabeling phases is the most common hidden error. Use the worksheets to operationalize; use the casebook to pattern-match under pressure.

A Appendix A: Macro spacing note

Macros like UTC/SEF, RT, OT, and LMF include `\xspace` and are declared robust. This prevents missing spaces in captions and headings (e.g., "UTC/SEFruns").

B Appendix B: Figure overlap note

All TikZ figures are wrapped in `adjustbox max width=\linewidth` to prevent margin overflow. Overlap is prevented by (i) placing combo nodes relative to the bottoms of prior nodes, not to earlier anchors, and (ii) boxing arrow labels with white fill and y-shifts.
